## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

IN RE APPLICATION OF:

OLIVER HARNACK, ET AL. : EXAMINER: YU, MELANIE J.

SERIAL NO.: 10/631,351 :

FILED: JULY 31, 2003 : GROUP ART UNIT: 1641

FOR: METHOD OF ATTACHING
HYDROPHILIC SPECIES TO
HYDROPHILIC MACROMOLECULES
AND IMMOBILIZING THE
HYDROPHILIC MACROMOLECULES
ON A HYDROPHOBIC SURFACE

## **REPLY BRIEF**

COMMISSIONER FOR PATENTS ALEXANDRIA, VIRGINIA 22313

SIR:

In response to the Examiner's Answer dated July 24, 2008, please consider the following comments.

Claim 2 of the present application requires immobilizing <u>hydrophilic</u> macromolecules on a <u>hydrophobic</u> surface, and then exposing the immobilized macromolecules to <u>hydrophilic</u> species. No reference cited by the Examiner discloses this sequence of steps. The Examiner relies on <u>Ford</u> for its disclosure of immobilizing hydrophilic macromolecules on a <u>hydrophilic</u> surface, and then exposing the immobilized macromolecules to hydrophilic species. *See* Examiner's Answer, pages 4, 5, 7 and 8. That is, <u>Ford</u> is alleged to disclose a process similar to that in claim 2, but in which a hydrophilic substrate is used. The Examiner relies on <u>Klein</u> or <u>Schueller</u> to remedy this deficiency of <u>Ford</u>. *See* Examiner's Answer, pages 5 and 8.

One of ordinary skill in the art would not have been motivated to combine Ford and Klein or Schueller as the Examiner proposes, because there would have been no reason to expect success upon combining the references. See MPEP §2143.02. Hydrophilic species are known to adsorb irreversibly to hydrophobic substrates upon contact – that is, hydrophilic species demonstrate non-specific binding. See generally Caldwell, Fan. Accordingly, a skilled artisan would expect that if Ford were modified to use a hydrophobic substrate, the hydrophilic species would bind not only to the immobilized macromolecule but also to the hydrophobic substrate. See, e.g., Appeal Brief, pages 6 to 7. A skilled artisan would expect that it would not be possible to confine the hydrophilic species to the locations of the immobilized macromolecule to create, e.g., nanowires, if a hydrophobic substrate were used in the process of Ford.

The Examiner argues that the teachings of <u>Caldwell</u> and <u>Fan</u>, which indicate that hydrophilic species bind non-specifically with hydrophobic substrates can be ignored. *See* Examiner's Answer, pages 11 to 12. The Examiner argues that <u>Caldwell's</u> teachings can be ignored because <u>Caldwell</u> indicates that antibodies and proteins bind non-specifically with hydrophobic substrates, and not nanoparticles as are used in <u>Ford</u>. *See* Examiner's Answer, page 11. The Examiner argues that <u>Fan's</u> teachings can be ignored because <u>Fan</u> indicates that hydrophilic nanoparticles bind to hydrophilic substrates as well as hydrophobic substrates. *See* Examiner's Answer, page 12. While the Examiner has certainly identified reasons why the teachings of <u>Caldwell</u> and <u>Fan</u> are not precisely synchronous with the teachings of <u>Ford</u>, the Examiner fails to consider the overall teaching of the references. *See*, *e.g.*, MPEP § 2141.01 (citing *W.L. Gore & Associates*, *Inc. v. Garlock*, *Inc.*, 220 USPQ 303 (Fed. Cir. 1983)) (prior art reference must be considered in its entirety, i.e., as a <u>whole</u>, including portions that would lead away from the claimed invention).

<u>Caldwell</u> teaches that hydrophilic species adsorb non-specifically to hydrophobic substrates. *See* <u>Caldwell</u>, column 1, lines 44 to 59. <u>Fan</u> teaches that the more hydrophobic a surface is, the greater the adsorption of hydrophilic gold particles to that surface. *See* <u>Fan</u>, FIG. 3. These references support Appellants' contention that a skilled artisan would expect that if <u>Ford</u> were modified to use a hydrophobic substrate, hydrophilic species would bind not only to the immobilized macromolecule but also to the hydrophobic substrate. The Examiner does not give proper weight to the overall teachings of <u>Caldwell</u> and <u>Fan</u>, and fails to provide a plausible counter-rationale for why one of ordinary skill in the art would expect success upon combining Ford with Klein or Schueller.

The references of record, when taken together, teach away from the combinations proposed by the Examiner. Accordingly, the rejections should be reversed.

Respectfully submitted,

OBLON, SPIVAK, McCLELLAND,

MAIER & NEUSTADT A.C.
